

BusinessFlow Voting Admin Web is a secure operations dashboard for managing a voting and prediction platform. It enables administrators to oversee the full topic lifecycle—from preview and publishing through active voting, closing, settlement, and deletion—while monitoring user activity and financial game data.

Key capabilities include role-based access control, account and user management, moderation workflows for reports and appeals, blacklists, maintenance controls, and configurable whitelists. Administrators can manage categories, tags, countries, languages, announcements, game settings, and payment/channel limits.

The platform also provides operational visibility into user bets, income, commissions, service fees, cashback, wallet balances, and balance adjustments. Built with React, TypeScript, Material UI, and a TypeScript/Node.js API, it supports a scalable, multi-currency system with secure authentication and audit-friendly financial controls.

Chatwoot — Portfolio Summary

Chatwoot is an open-source, self-hosted customer engagement platform—similar to Intercom or Zendesk. It helps businesses manage customer conversations from multiple channels in one shared workspace.

Business Flow

```
Customer contacts business
↓
Website / Email / WhatsApp / Instagram / Facebook / SMS / API
↓
Chatwoot centralizes messages into a shared inbox
↓
System identifies customer and shows CRM context
↓
Conversation is assigned to the right support or sales agent
↓
Agent replies, collaborates via private notes, and uses saved replies
↓
Labels, custom fields, automation, APIs, and webhooks support the workflow
↓
Business resolves the case and maintains customer history for future engagement
```

Core Business Value

- Unifies customer communication across social, messaging, email, and website chat.
- Gives support and sales teams a single view of each customer and their conversation history.

- Improves response time with agent assignment, saved replies, labels, and internal collaboration.
- Supports multiple brands or teams through shared inboxes.
- Enables tailored workflows with CRM data, custom attributes, APIs, webhooks, and integrations.
- Can be self-hosted, giving businesses more control over their customer data.

Portfolio Description

Built with Chatwoot, an open-source omnichannel customer engagement platform that centralizes customer inquiries from web chat, email, WhatsApp, social media, SMS, and custom APIs. The platform enables teams to manage shared inboxes, customer profiles, conversation assignments, private collaboration notes, automated workflows, and integrations—helping businesses provide faster, more organized customer support and engagement.

Technical Snapshot

- Backend: Ruby on Rails
- Frontend: Vue.js
- Real-time communication: Action Cable
- Deployment: Docker, Heroku, DigitalOcean/Kubernetes
- Extensibility: REST APIs, webhooks, Slack and channel integrations

iOneCards — Portfolio Summary

iOneCards is a Cambodia-focused e-commerce and loyalty web application that connects customers with products, merchants, promotions, vouchers, and rewards in one digital platform.

Customers can browse product categories and merchant stores, discover flash deals and popular products, save items, manage a cart, apply coupons, and complete orders through supported local payment methods. The platform also provides account features such as order history, reward points, saved products, messages, reviews, followable merchants, and help-center support.

Business flow

Discover products / merchants → Add items to cart → Select delivery or pickup details → Apply vouchers → Choose payment method → Place order → Track/manage orders and earn/use rewards

Key capabilities

- Multi-merchant marketplace with product catalogues and merchant pages
- Promotions, flash deals, vouchers, coupons, freebies, and best-offer campaigns
- Cart and checkout flows for single-product and multi-merchant orders

- Payments through ABA Pay, cards, Wing, and Pi Pay; supports full and down payments
- Customer login, registration, password recovery, and Apple sign-in integration
- Account dashboard for orders, points, reviews, saved items, coupons, and profile updates
- English and Khmer localized experiences
- Customer service and help-center pages
- PWA-ready, mobile-responsive frontend with analytics and lazy-loaded media

Technology

Built as a Nuxt.js 2 single-page application using Vue.js, Vuex, Axios, Bootstrap, Vue I18n, PWA support, and JWT-style authentication. It integrates with an external iOneCards API for product, cart, account, order, and payment operations.

Short portfolio description

Developed a multilingual e-commerce and customer-loyalty web application for iOneCards in Cambodia. The platform enables users to discover merchants and products, access promotions and vouchers, manage carts, make secure payments, and track orders and rewards through a responsive Nuxt.js/Vue.js experience.

Gorden Web — BusinessFlow

Gorden Web is a multilingual, responsive web platform for discovering and accessing digital entertainment content. It serves as a central experience for users to browse music, artists, albums, top charts, new releases, and audiobooks, while connecting them to the Gorden/E-Play mobile ecosystem.

Project overview

The platform was designed to make a large media catalog easier to explore across different countries, genres, and content types. Users can search for songs, artists, albums, and audiobooks; view detailed content pages; play audio; create collections; and use QR codes or deep links to continue their experience in a mobile app.

Gorden Web — BusinessFlow

A responsive, multilingual music and audiobook discovery platform.

- Browse music, artists, albums, new releases, and top charts
- Search songs, albums, artists, and audiobooks
- Play audio and save tracks to collections
- Share content and collections through QR codes and deep links

- Supports 30+ languages and mobile/desktop layouts
- Built with Nuxt.js, Vue.js, Vuetify, Vuex, and REST APIs
- Deployed as a Dockerized static site with Nginx

Developed Gorden Web, a multilingual entertainment platform that enables users to discover, search, play, and share music and audiobook content. Built with Nuxt.js and Vue.js, with API integration, Vuex state management, QR sharing, mobile deep links, and responsive UI design.

Gorden Web — BusinessFlow

Gorden Web is a multilingual, responsive web platform for discovering and accessing digital entertainment content. It provides a central experience for users to browse music, artists, albums, top charts, new releases, and audiobooks, while connecting seamlessly with the Gorden/E-Play mobile ecosystem.

The platform makes a large media catalog easy to explore across countries, genres, and content types. Users can search for songs, artists, albums, and audiobooks; view detailed content pages; play audio; create collections; and share or continue content through QR codes and mobile deep links.

Built with **Nuxt.js, Vue.js, Vuetify, Vuex, and REST APIs**, Gorden Web supports 30+ languages and delivers a responsive experience across desktop and mobile devices. The application is deployed as a Dockerized static site using Nginx.

OFL Admin Web is a React and TypeScript back-office platform for managing a digital payments and card-services operation. Built for BusinessFlow, it gives operations teams a centralized workspace to oversee users, KYC applications, issued-card requests, card stock, transactions, fees, currencies, content, and platform settings.

Key capabilities include role-based access control, secure administrator account controls, customer and KYC review workflows, card application and transaction management, transaction-history reporting, configurable spending limits and fees, multilingual settings, announcements and banners, and maintenance-mode controls.

The project uses React, TypeScript, React Router, Material UI, Tailwind CSS, Recharts, and Webpack. Its modular, permission-aware design supports secure day-to-day operations while keeping financial workflows clear and manageable.
